This volume contains mainly the revised versions of papers presented at the workshop '98, "Beyond the Notation", that took place in Mulhouse, France on June 3-4, 1998. We thank all those that have made this possible, and particularly all the people in Mulhouse that worked hard to make this meeting a success, with such a short delay between the announcement and the realization. We are specially grateful to Nathalie Gaertner, who put in a tremendous amount of effort in the initial preparation of the workshop. We were pleasantly surprised of the quality of the submitted material and of the level of the technical exchanges at the Mulhouse meeting. More than one hundred attendees, from about twenty different countries, representing the main actors in the UML research and development scene, gathered in Mulhouse for two full study days. We would like to express our deepest appreciation to the authors of submitted papers, the editorial committee for this volume, the program committee for the initial workshop, the external referees, and many others who contributed towards the final contents of this volume. for International Trade: Theory and Policy, 10/e Every paleontologist dreams of studying live dinosaurs in their natural environment. There's only one small hurdle in the way: sixty-five million years. But unlike so many of his peers, Matthew Carrington has real reason to believe he'll be making such a journey to the far reaches of a bygone era. Now, thanks to a colleague's major technological breakthrough, time travel has just vaulted from the theoretical to the possible. But before Matthew can experience such an adventure, problems arise: delays, politics, and greed plague the project. Against his better judgment, he chooses to stay on board. The result is nothing short of a disaster. Now, Matthew and his team are stranded in the past, where they have to deal with isolation, predators, disease, and their own shortcomings. Hopes of ever making it back to the Holocene are dwindling with each catastrophe they encounter. Total human world population: nine and rapidly decreasing.

Statistical Rethinking: A Bayesian Course with Examples in R and Stan builds readers' knowledge of and confidence in statistical modeling. Reflecting the need for even minor programming in today's model-based statistics, the book pushes readers to perform step-by-step calculations that are usually automated. This unique computational approach ensures that readers understand enough of the details to make reasonable choices and interpretations in their own modeling work. The text presents generalized linear multilevel models from a Bayesian perspective, relying on a simple logical interpretation of Bayesian probability and maximum entropy. It covers from the basics of regression to multilevel models. The author also discusses measurement error, missing data, and Gaussian process models for spatial and network autocorrelation. By using complete R code examples throughout, this book provides a practical foundation for performing statistical inference. Designed for both PhD students and seasoned professionals in the natural and social sciences, it prepares them for more advanced or specialized statistical modeling.

Web Resource The book is accompanied by an R package (rethinking) that is available on the author's website and GitHub. The two core functions (map and map2stan) of this package allow a variety of statistical models to be constructed from standard model formulas.
